Project: EMPLOYEE WORKING HOURS AND SALARY MANAGEMENT

Create a project with the following 4 tables:

- Account(id, username, password, role)
- Employee(id, code, fullname, email, phone, hourlyRate, accountId)
- WorkLog(id, employeeId, workDate, checkInTime, checkOutTime, totalHours, status)
- Salary(id, employeeId, month, year, totalHours, overtimeHours, totalSalary, status)

And required functionalities:

- Login: Implement a login function with two roles: Admin and Employee, and provide the corresponding functions for each role.
- Login Account Storage: Store login account information using SharedPreferences.
- Data Storage: Store the tables using SQLite or Room Database.
- Employee Management: Allow administrators to add, update, delete, search, and view employee information, including hourly rates.
- Attendance Management: Allow employees to check in and check out daily. Record the working date, check-in time, and check-out time.
- Working Hours Calculation: Automatically calculate the total working hours for each employee based on check-in and check-out times.
- Salary Calculation: Automatically calculate monthly salaries based on total working hours and hourly rates. Support overtime calculations based on predefined overtime rates.
- Salary Management: Allow employees to view their monthly working hours, overtime hours, and salary details. Allow administrators to view and manage salary records.
- Attendance History: Allow employees to view their daily attendance records and monthly working-hour summaries.
- Data Validation: Prevent duplicate check-ins, invalid check-out times, and incomplete attendance records.

- Version Control and Collaboration: Work together and manage the project code using GitHub or GitLab.
- Scoring: The score is based on the time taken to complete the project. The less time a student takes, the higher the score.
